

# Qwen2 model

## Qwen2 model

- Model scale
- Performance performance
- Got Qwen2
- Use Qwen2
- Run Qwen2
- Dialogue
- End conversation
- Reference material

## Demonstration environment

**\*\*Development Board \* \*:** Raspberry Pi 5B  
**SD(TF)card:** 64G (Above 16G, the larger the capacity, the more models can be experienced)

Raspberry Pi 5B (8G RAM): Run 8B and below parameter models  
Raspberry Pi 5B (4G RAM): Run 3B and below parameter models

## Model scale

Model	参数
Qwen2	0.5B
Qwen2	1.5B
Qwen2	7B
Qwen2	72B

Raspberry Pi 5B (8G RAM): Test Qwen2 model with parameters of 7B and below.  
Raspberry Pi 5B (4G RAM): Test Qwen2 model with parameters of 1.5B and below.

## Performance performance

	Qwen2-7B Instruct	Llama3-8B Instruct	GLM4-9B Chat
AlignBench	7.21	6.20	7.01
MT-Bench	8.41	8.05	8.35
MMLU	70.5	68.4	72.4
GSM8K	82.3	79.6	79.6
MATH	49.6	30.0	50.6
HumanEval	79.9	62.2	71.8
C-Eval	77.2	45.9	75.6

## Got Qwen2

Using the pull command will automatically pull the models from the Ollama model library.

### Raspberry Pi 5B (8G RAM)

```
ollama pull qwen2:7b
```

### Raspberry Pi 5B (4G RAM)

```
ollama pull qwen2:1.5b
```

## Use Qwen2

### Run Qwen2

#### Raspberry Pi 5B (8G RAM)

If the system does not have a running model, the system will automatically pull the Qwen2 7B model and run it.

```
ollama run qwen2:7b
```

#### Raspberry Pi 5B (4G RAM)

If the system does not have a running model, the system will automatically pull the Qwen2 1.5B model and run it.

```
ollama run qwen2:1.5b
```

### Dialogue

#### Raspberry Pi 5B (8G RAM)

```
Tell me something about large language models.
```

The response time to the question is related to the hardware configuration, please be patient and wait.

```

pi@raspberrypi:~$ ollama run qwen2:7b  
>>> Tell me something about large language models.  
Large language models are sophisticated artificial intelligence systems designed to generate human-like text by learning patterns and structures from vast amounts of textual data. These models have been trained on massive datasets, sometimes containing billions or even trillions of parameters, making them highly complex and capable of producing a wide range of outputs, including essays, stories, poetry, and code.  
  
The training process involves feeding the model large volumes of text, allowing it to learn patterns in language use, semantics, syntax, and context. This enables the model to generate responses that are coherent, relevant, and sometimes even creative.  
  
One key feature of large language models is their ability to handle a variety of input prompts or questions, which they then use to produce output that continues the text in a plausible manner. The more data the model has been trained on, the better it can generalize across different types of content and topics.  
  
These models have numerous applications, including but not limited to:  
  
1. Automated Writing: They are used for generating text, which can be useful for creating content for websites, blogs, or even marketing materials.  
2. Virtual Customer Service: Large language models can simulate human-like conversations with customers, providing personalized responses and potentially improving customer service experiences.  
3. Translation Services: By understanding the nuances of various languages, these models can translate text between languages accurately and efficiently.  
4. Educational Tools: They can be used to create adaptive learning platforms that tailor educational content based on individual student needs.  
5. Research and Development: In fields like medicine, science, and technology, large language models assist in summarizing research papers, generating hypotheses, or even helping with data analysis.  
  
However, they also come with challenges and limitations. Large language models can generate biased or inappropriate content if the training data contains such biases. Additionally, their outputs are not always factually accurate, especially when dealing with new topics that were not part of their training dataset. Furthermore, the computational resources required to train these models are significant and may pose ethical concerns regarding energy consumption.
```

>>> Tell me something about large language models.  
Large language models, also known as generative language models, are artificial intelligence systems that can generate text in response to prompts or instructions. They are a type of machine learning model and have been developed for a wide range of tasks, including but not limited to translation, summarization, chatbot generation, and generating creative content.  
  
These models typically use deep neural networks and other advanced algorithms to learn from large amounts of text data. The size of the models is measured in terms of parameters or size of the model's hidden layers, with larger models having more parameters that enable them to generate text with greater fluency and diversity.  
  
Large language models have shown remarkable improvement in performance over the years, surpassing even human language abilities in certain areas, such as machine translation. However, they also raise concerns about bias, privacy, and the ethical implications of creating and using large language models for commercial or military purposes.

The training process involves feeding the model with a large amount of text data, including semantics, syntax, and context. This enables the model to generate text that is coherent and even creative.

One key feature of large language models is their ability to generate text that continues the input. The better it can generalize across different inputs, the better it can generate text.

These models have numerous applications, including:

1. **Automated Writing**: They are used for generating blog posts, reports, or even marketing materials.
2. **Virtual Customer Service**: Large language models can provide personalized responses and potentially improve customer service.
3. **Translation Services**: By understanding the context and meaning of text, they can translate between languages accurately and efficiently.
4. **Educational Tools**: They can be used to generate educational content, answer questions, or provide personalized learning experiences.
5. **Research and Development**: In fields like medicine, biology, or materials science, they can help summarize research papers, generate hypotheses, or even design new experiments.

However, they also come with challenges and limitations. For example, they can generate content that is biased or contains harmful information if the training data contains such biases. Additionally, the computational resources required to train these models are significant and may pose ethical concerns regarding energy consumption.

Overall, large language models represent a powerful tool in the realm of natural language processing (NLP), offering both opportunities for innovation and areas needing careful consideration and management.

pi@raspberrypi:~ $ ollama run qwen2:1.5b
>>> Tell me something about large language models.
Large language models, often abbreviated as LLMs or GPT (Generative Pre-trained Transformer), are artificial intelligence systems that have the ability to generate human-like text based on a set of training data and algorithms. These models have been trained on vast amounts of text data, including books, movies, news articles, social media posts, and scientific papers, among others.

Here is some information about large language models:

* **Training**: LLMs are typically trained using deep learning techniques, which involve the use of neural networks to analyze large volumes of text data. This allows them to learn from patterns in the text and generate more sophisticated responses.
* **Processing**: To process natural language, LLMs use complex algorithms that involve understanding the context, grammar, and semantics of the input text. They also use rule-based processing to generate output that follows specific rules, as well as understanding the meaning behind the words.
* **Applications**: Large language models have a wide range of applications, including text generation, translation, summarization, and keyword extraction. They can also be used for sentiment analysis, image captioning, and even generating code.

Some examples of LLMs include GPT-1 and GPT-2, which were developed by OpenAI, and the Transformer-based pre-trained model (BERT), which was developed by Google.
